Block and Inline elements

Every HTML element has a default display value, depending on what type of element it is. There are two display values: **block** and **inline**.

Block elements

A block-level element always starts on a new line. It always takes up the full width available

The `<div>` element is a block-level element.

Block element example:

```
<div>Hello World</div>
```

List of main block Elements

<h1> - <h6>

Html element, for putting header

<p>

Html element, for creating paragraph

<table>, <form>

Html elements for creating table and form(getting data from user) in browser

<div>

Html element, it's like container, used for collecting elements

<header>, <footer>

Html elements for dividing page

**, , **

Html element for creating lists in browser

Inline elements

An inline element does not start on a new line. It takes only as much width as necessary.

Note: An inline element cannot contain a block-level element!

The `` element is an inline-level element.

inline element example:

```
<span>Hello World</span>
```

List of main inline Elements

<a>

Html element for creating link in browser

Html element for putting image in browser

<input> , <button>

Html elements, for getting and submitting something in browser

An inline container used to mark up a part of a text

**
**

Html element for dividing elements, it will add new line

<label>

label tag is used to define a caption for an element in an HTML form

**That's it, you already know main
html elements.**

Let's learn CSS and style our html documents

@softclub.tj

Add CSS to html file

To add style in your page, you need to add **<style>** tag in head of your page

Then you should select element from html page and style.

In order to do this, you should know about **selectors**, **let's see what is selector is**

<> text.html •

HTML CSS > <> text.html > html > head

```
1  <!DOCTYPE html>
2  <html>
3    <head>
4      <title>Page Title</title>
5      ...<style>
6      .....
7      ...</style>
8    </head>
9    <body>
10     <p>Lorem ipsum dolor sit.</p>
11   </body>
12 </html>
13
```

02

CSS selectors

@softclub.tj

CSS selectors

CSS selectors are used to "find" the HTML elements you want to style.

Simple CSS selectors:

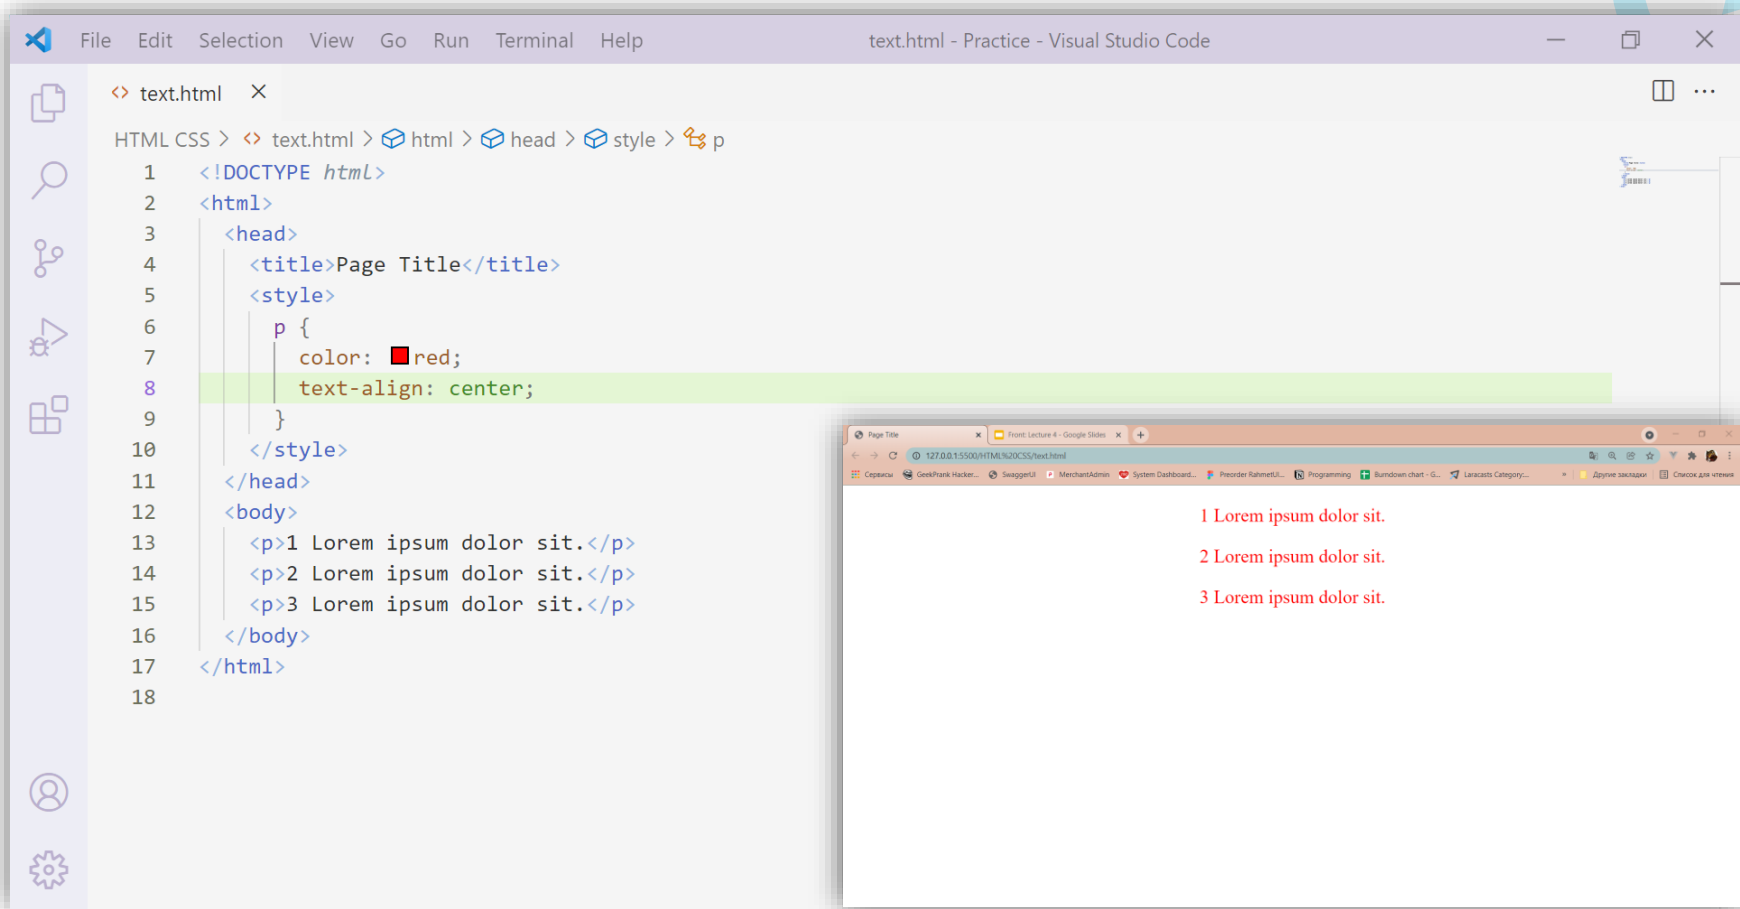

- Type
- Id
- Class

Select by Type

The element selector selects HTML elements based on the element name.

Here, all <p> elements on the page will be center-aligned, with a red text color:

```
p {  
  text-align: center;  
  color: red;  
}
```

Select by Id

The id selector uses the id attribute of an HTML element to select a specific element.

The id of an element is unique within a page, so the id selector is used to select one unique element!

Note: An id name cannot start with a number!

The CSS rule below will be applied to the HTML element with `id="para1"`:

```
#para1 {  
  text-align: center;  
  color: red;  
}
```

<> text.html X

HTML CSS > <> text.html > html > body > p

```
1  <!DOCTYPE html>
2  <html>
3    <head>
4      <title>Page Title</title>
5      <style>
6        #para1 {
7          color: red;
8          text-align: center;
9        }
10     </style>
11   </head>
12   <body>
13     <p id="para1">1 Lorem ipsum dolor sit.</p>
14     <p>2 Lorem ipsum dolor sit.</p>
15     <p>3 Lorem ipsum dolor sit.</p>
16   </body>
17 </html>
18
```

Select by Class

- The class selector selects HTML elements with a specific class attribute.
- **Note:** A class name cannot start with a number!
- In this example all HTML elements with class="center" will be red and center-aligned:

```
.center {  
  text-align: center;  
  color: red;  
}
```

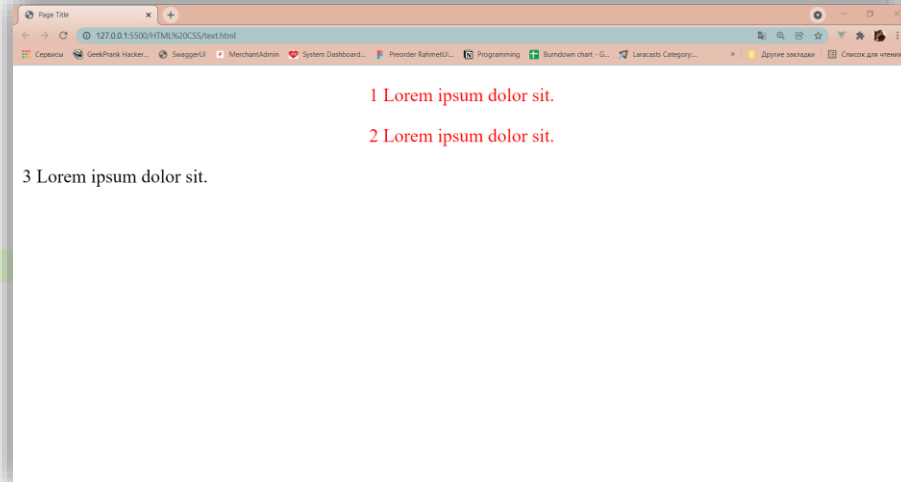

<> text.html ×

HTML CSS > <> text.html > ...

```
1  <!DOCTYPE html>
2  <html>
3    <head>
4      <title>Page Title</title>
5      <style>
6        .center {
7          color: red;
8          text-align: center;
9        }
10     </style>
11   </head>
12   <body>
13     <p class="center">1 Lorem ipsum dolor sit.</p>
14     <p class="center">2 Lorem ipsum dolor sit.</p>
15     <p>3 Lorem ipsum dolor sit.</p>
16   </body>
17 </html>
18
```

03

Height/width (max-min)

Height / Width

The CSS **height** and **width** properties are used to set the height and width of an element.
Simple CSS selectors

CSS height and width Values

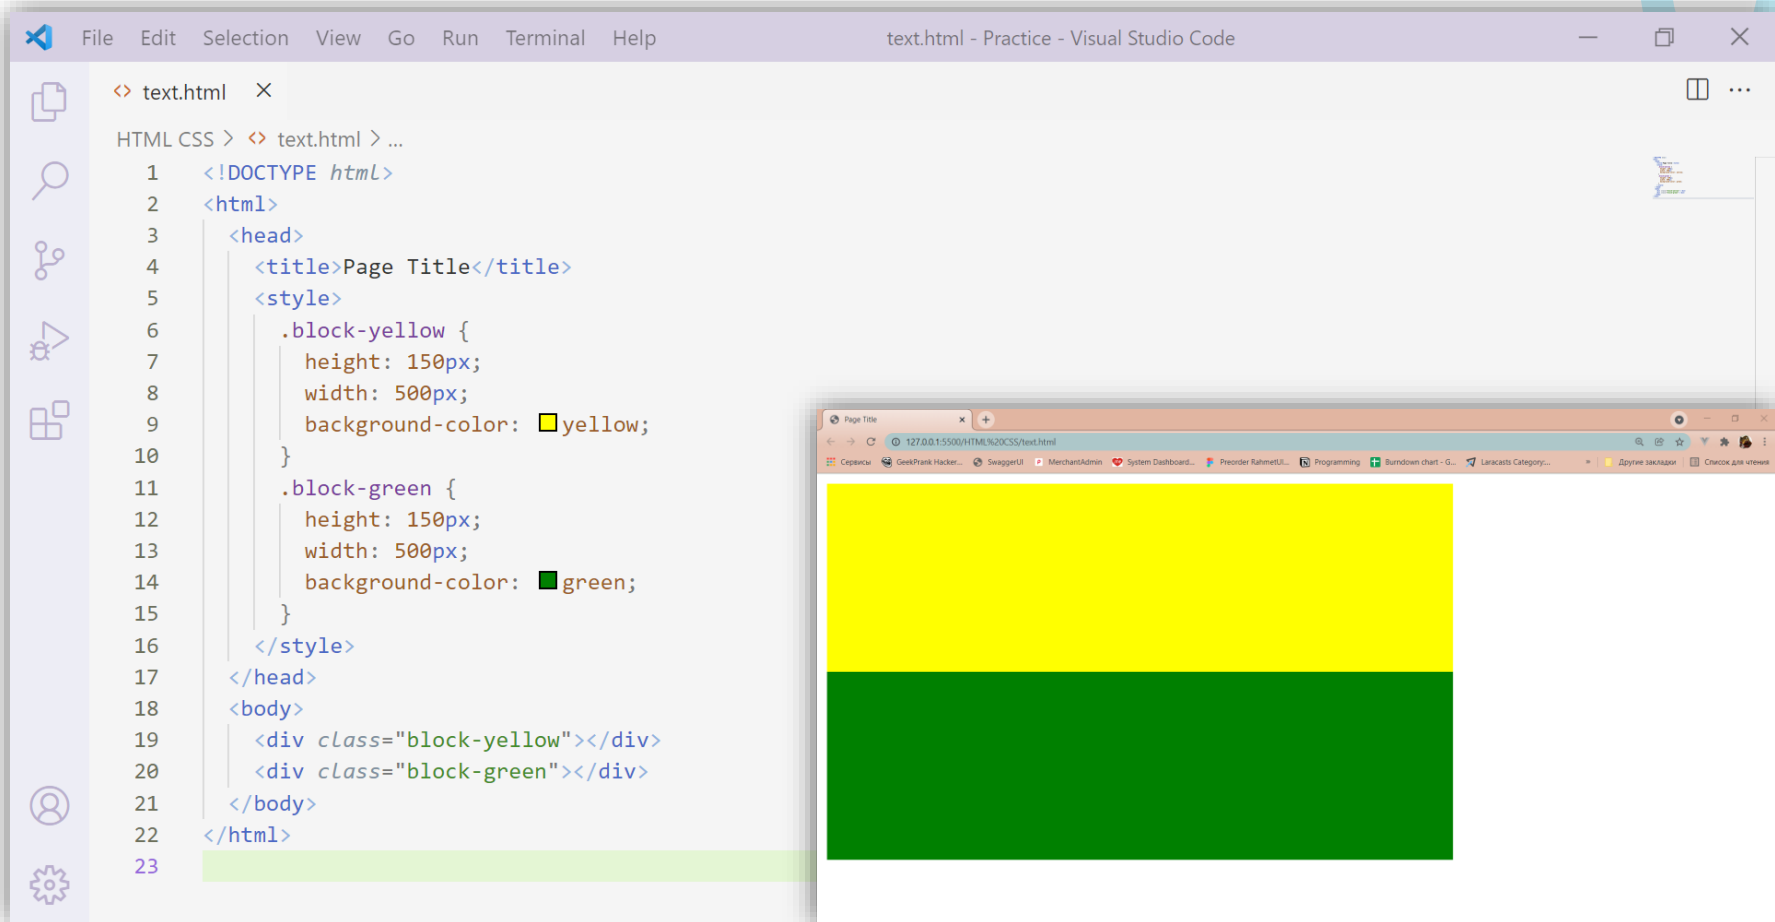

The **height** and **width** properties do not include padding, borders, or margins. It sets the height/width of the area inside the padding, border, and margin of the element.

The height and width properties may have the following values:

auto - This is default. The browser calculates the height and width

length - Defines the height/width in **px, cm etc.**

% - Defines the height/width in **percent of the containing block**

04

Text Align

TEXT Alignment

Left Aligned

Center Aligned

Right Aligned

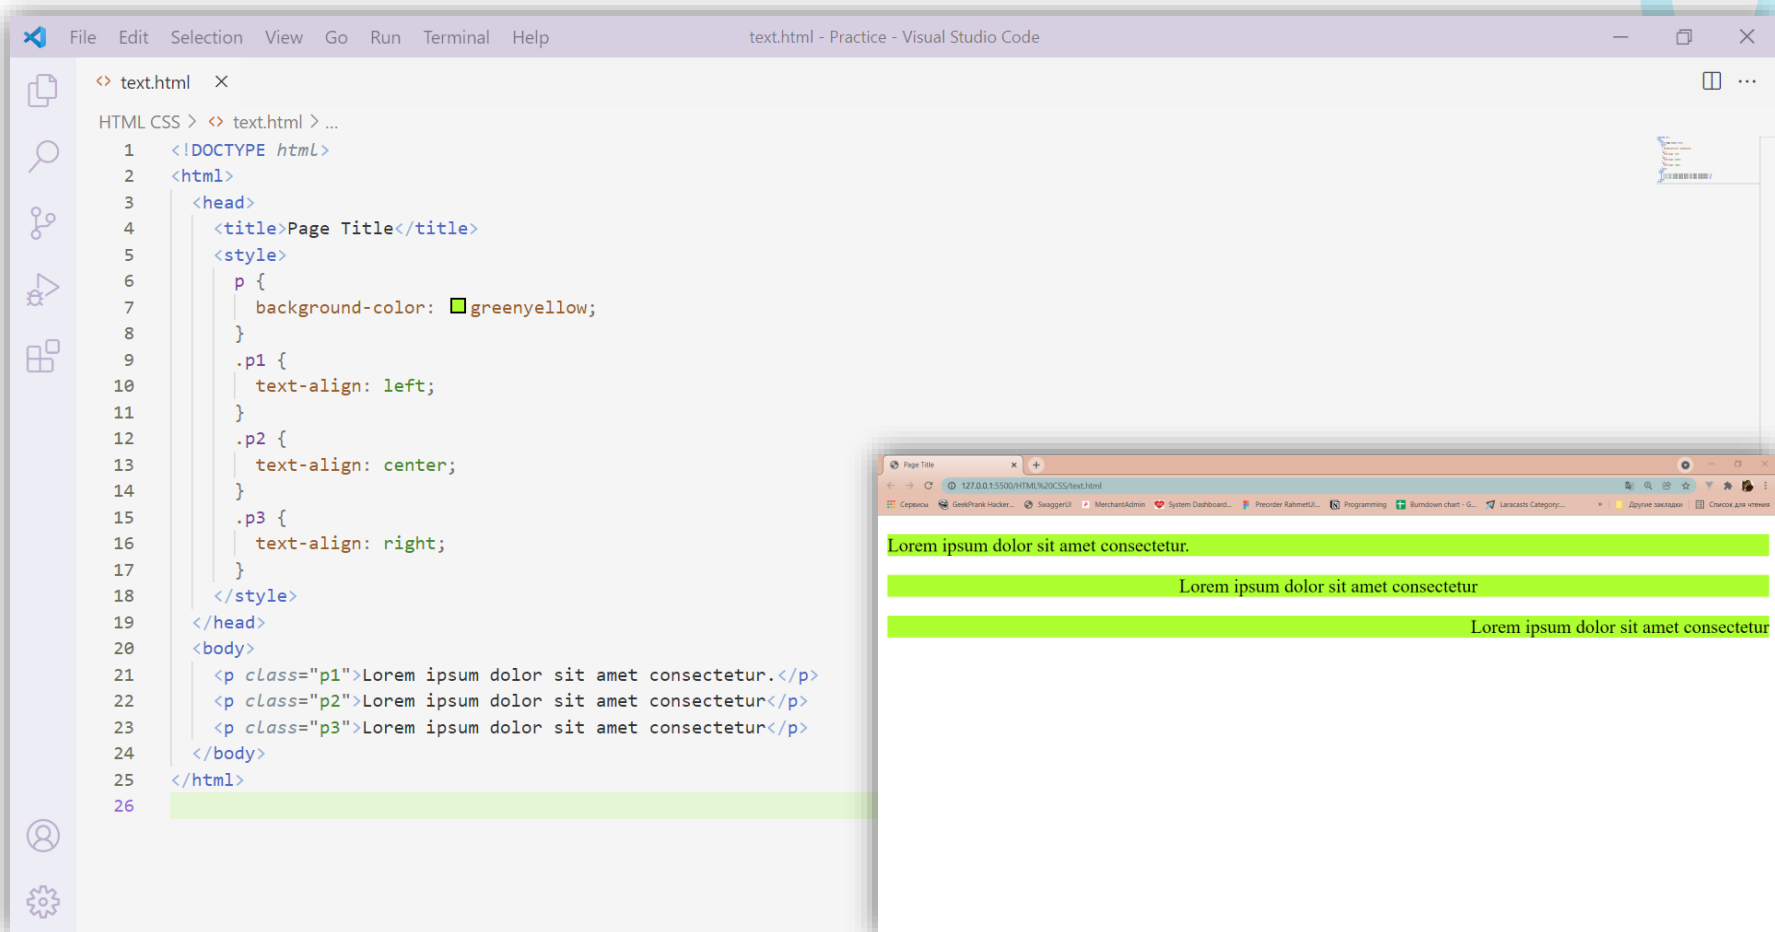

Justified

Text alignment

The **text-align** property is used to set the horizontal alignment of a text.

left | center | right | justified

Be happy and Smile

Thanks!

“don't stop when you're tired
stop when you are done.”
